

PRODUCT OVERVIEW

Document extraction for sub-award teams.

OVERVIEW

DOCex is a document extraction product for sub-award teams at NGOs and foundations. It reads partner application bundles and quarterly reports, and answers a defined set of questions about each partner — with the source document and a verbatim quote for every answer.

THE PROBLEM

Sub-award teams currently rely on manual reading and Ctrl-F across separate PDFs to verify whether partners are registered, audited, or compliant with funder requirements. A single screening cycle of 200 applications can take a three-person team two weeks of manual review. The same pattern repeats every quarter when partner reports come in.

HOW IT WORKS

- 1. Define questions.** The grants officer types or selects the questions she wants answered for every partner.
- 2. Upload documents.** The full bundle for each applicant — registration, audit, profile, proposal, policies — gets dropped in.
- 3. Review answers.** DOCex returns one structured answer per question, with the source document, the verbatim quote, and a confidence label (Found, Inferred, or Not found).

OUTPUT

Every screening run produces an Excel file with one row per applicant and one column per question. Quotes are verbatim from the source document — the same evidence a manual review would surface, in a format that holds up to audit.

HOW TO USE IT

1. Open DOCex in your browser.
2. On Step 1, define your questions. Use the Common Questions chips to add standard items, or type your own.
3. Optional — add a short paragraph in the Context box describing what your funder cares about.
4. On Step 2, choose Single applicant or Batch mode. Type each applicant's name and drop in their full document bundle (PDF, DOCX, or TXT).
5. Click Screen applications. DOCex reads every document and returns a structured table.
6. Click any answer to see the source document and verbatim quote. Click Download Excel to export the results for your file.

WHAT IT DOES NOT DO

DOCex extracts information from documents you provide. It does not score, rank, or recommend applicants. It does not search the open web. It does not store your documents — extraction runs from your machine and the only data flow is to the AI model used for inference.

STATUS & PILOT

DOCex is currently in pilot conversations with sub-award teams in Nigeria. Built by Farid Abdurrahman in collaboration with practitioners in the Gates Foundation funding ecosystem. Looking for design partners running active sub-award cycles or partner-report reviews in 2025–2026.
